

10 years ago, Dad was worrying about his prostate cancer.

Today, he's only worrying about me.

When the diagnosis is prostate cancer, men can choose from various treatment options, including surgery, radiation and chemotherapy. But only ONE treatment option is non-invasive, performed in an outpatient setting and provides a 95.4% decrease in PSA levels with 80% of patients remaining cancer-free for up to 10 years.

HIFU (High Intensity Focused Ultrasound) destroys prostate cancer cells using targeted, ultrasound energy while leaving the surrounding healthy tissue untouched. *No incision, no chemotherapy, no radiation and no overnight hospital stay.* Simply put, HIFU is tomorrow's prostate cancer solution, today.

HIFU significantly decreases the risk of impotence from 80% to 2%, and incontinence from 20% to 0.4% when compared to traditional treatments.
